AB The invention is related to a web or **fabric** made with high performance **fibers** or filaments having properties such as high melting, chem. resistance, non- burning, strong, non-wetting, high purity. The web also contains **fibers** or filaments with individual deniers between 0.5 and 300 made from melt processable perfluoropolymers. The **fabric** is thermally treated so as to allow the melt processable perfluoropolymer **fibers** (e.g., PTFE **fibers**) and yarns to partially, or fully, melt and adhere to the other **fibers** in the web or **fabric** matrix. The **fabric** or web is capable of being **molded**, drawn, or formed using pressure or vacuum prior to the thermal treatment process, then fixed into place during the thermal treatment process, making a high performance **fabric** or web **article**.

AB The **carbon fiber**-reinforced base materials (A1) comprise **fabrics** (A) of **carbon fiber** bundles comprising multiple **carbon fiber** filaments and exhibiting tensile modulus .gtoreq.210 GPa and breaking energy .gtoreq.40 MJ/m³, and polymers (B) adhered to the **fabrics** with B polymer content 1-20 **parts** per 100 **parts** A **fabric**, or the **carbon fiber**-reinforced base materials comprise A1 base materials exhibiting air permeation rate 10-200 cm³/cm²-s, or the **carbon fiber**-reinforced base materials having B polymers adhered to the surface of A **fabrics** in the dotted form with diam. of the dots .ltoreq.1 mm, or the **carbon fiber**-reinforced base materials comprise A1 base materials having B polymers existing on the surface of B **fabrics** in the noncontinuous form, or the **carbon fiber**-reinforced base materials comprise A1 base materials having the m.p. or flow initiation temp. of B polymers 50-150.degree., or the **carbon fiber**-reinforced base materials comprise A1 base materials having polymers (C) showing no soly. or flowability at the m.p. or the flow initiation temp. of B polymers adhered to A **fabrics** with C polymer content 1-10 **parts** per 100 **parts** A **fabric**. The preforms (D) comprise laminates of .gtoreq.2 of A1 base material and have the base materials bonded together by B or C polymers. The composites essentially comprise D preforms impregnated with polymers other than B polymers. The composites are useful for primary structures, secondary structures, external materials, interior materials, and **parts** for aircrafts, automobiles, and ships. A **woven fabric** comprising polyacrylonitrile-type **carbon fiber** bundles with no. of filaments 24,000, tensile strength 5830 MPa, modulus 294 GPa, and breaking energy 58 MJ/m³ as warp yarns and glass **fiber** bundles as auxiliary filling yarns was prepd., coated with a particulate polymer compn. contg. 60% polyether sulfone (Sumikaexcel 50003P) and 40% epoxy resin (AK-601) to form a **fabric** with polymer compn. content 10 **parts** per 100 **parts** **fabric**, heated at 180-200.degree. by IR rays, pressed, cooled, and wound to give a **carbon fiber**-reinforced base material 0.36 mm thick and showing air permeation rate 23.7 cm³/cm²-s and cover factor 99%. A laminate of the base material was vacuum **molded** in the cavity of a mold for 1 h at mold temp. 80.degree. to give a preform. The preform was impregnated with a compn. contg. Araldite MY-721, Epikote 825, AK-601, Epiclon HP-7200L, Epicure W, 3,3'-diaminodiphenyl sulfone, and Sumicure S and cured 2 h at 180.degree. in a mold to give a composite showing no pin holes and no voids and exhibiting compression strength at normal temp. after impact 248 MPa and compression strength at high temp. after heat-treatment in the wet state 972 MPa.

AB A thermoplastic composite is prepd. by applying a hydroxy-phenoxyether polymer onto the surface of reinforcing **fibers** or by the in-situ polymn. of mixts. of diepoxides and difunctional species in the presence of reinforcing **fibers**. The composites can be **molded** into shaped **articles** useful for structural materials and **parts** by conventional thermoforming or other fabrication techniques. A composite was prepd. by molding a mixt. of DER 332 and monoethanolamine in the presence of a glass **fiber/carbon fiber woven fabric** to give a thermoformable composite having tensile modulus 2.2 .times. 106 psi.
